# Near Butson-Hadamard Matrices

- $\mathcal{E}_m = \{1, \zeta_m, \zeta_m^2, \dots, \zeta_m^{m-1}\}$
- A Butson-Hadamard matrix is a square matrix H of order v with entries in  $\mathcal{E}_m$  such that  $H\overline{H}^T = vI$ .
- denoted by BH(v, m).
- BH(v, 2) is so called Hadamard matrix of order v
- Near Butson-Hadamard matrix  $BH_{\gamma}(v, m)$  of type  $\gamma$ :

## Near Butson-Hadamard Matrices

• 
$$\mathcal{E}_m = \{1, \zeta_m, \zeta_m^2, \dots, \zeta_m^{m-1}\}$$

- A Butson-Hadamard matrix is a square matrix H of order v with entries in  $\mathcal{E}_m$  such that  $H\overline{H}^T = vI$ .
- denoted by BH(v, m).
- BH(v, 2) is so called Hadamard matrix of order v
- Near Butson-Hadamard matrix  $BH_{\gamma}(v, m)$  of type  $\gamma$ :  $H\overline{H}^{T} = (v - \gamma)I + \gamma J$  for a  $\gamma \in \mathbb{R} \cap \mathbb{Z}[\zeta_{m}]$ .

Ideal Factorization Method

## Main equation

#### Example 2

Similarly, we obtained by an exhaustive search that  $BH_{\gamma}(8,5)$  exists for  $\gamma \in \{-\xi_5^3 - \xi_5^2 + 5, -\xi_5^3 - \xi_5^2, 8, \xi_5^3 + \xi_5^2 + 1, \xi_5^3 + \xi_5^2 + 6\}$  with  $|\gamma| \in \{6.61, 1.61, 8, 0.61, 4.38\}$ , respectively.

・ロト ・ 同ト ・ ヨト ・ ヨト

Ideal Factorization Method

Applications

## Main equation

#### Example 2

Similarly, we obtained by an exhaustive search that  $BH_{\gamma}(8,5)$  exists for  $\gamma \in \{-\xi_5^3 - \xi_5^2 + 5, -\xi_5^3 - \xi_5^2, 8, \xi_5^3 + \xi_5^2 + 1, \xi_5^3 + \xi_5^2 + 6\}$  with  $|\gamma| \in \{6.61, 1.61, 8, 0.61, 4.38\}$ , respectively. In particular, the matrix H has  $\gamma = -\xi_5^3 - \xi_5^2 + 2$  with  $|\gamma| = 0.61$ 

$$H = \begin{bmatrix} 1 & 1 & \zeta_{5}^{2} & \zeta_{5}^{3} & 1 & \zeta_{5}^{3} & \zeta_{5} & 1 \\ 1 & 1 & 1 & \zeta_{5}^{2} & \zeta_{5}^{3} & 1 & \zeta_{5}^{3} & \zeta_{5} \\ \zeta_{5} & 1 & 1 & 1 & \zeta_{5}^{2} & \zeta_{5}^{3} & 1 & \zeta_{5}^{3} \\ \zeta_{5}^{3} & \zeta_{5} & 1 & 1 & 1 & \zeta_{5}^{2} & \zeta_{5}^{3} & 1 \\ 1 & \zeta_{5}^{3} & \zeta_{5} & 1 & 1 & 1 & \zeta_{5}^{2} & \zeta_{5}^{3} \\ \zeta_{5}^{3} & 1 & \zeta_{5}^{3} & \zeta_{5} & 1 & 1 & 1 & \zeta_{5}^{2} \\ \zeta_{5}^{2} & \zeta_{5}^{3} & 1 & \zeta_{5}^{3} & \zeta_{5} & 1 & 1 & 1 \\ 1 & \zeta_{5}^{2} & \zeta_{5}^{3} & 1 & \zeta_{5}^{3} & \zeta_{5} & 1 & 1 \end{bmatrix}$$

ヘロト ヘヨト ヘヨト

• 
$$H\overline{H}^T = (v - \gamma)I + \gamma J$$

イロト イポト イヨト イヨト

• 
$$H\overline{H}^T = (v - \gamma)I + \gamma J$$

•  $\det(H) \in \mathbb{Z}[\zeta_m]$ 

イロン イヨン イヨン イヨン

• 
$$H\overline{H}^T = (v - \gamma)I + \gamma J$$

• 
$$\det(H) \in \mathbb{Z}[\zeta_m]$$

• 
$$\det(H\overline{H}^T) = \det(H)\overline{\det(H)} = ((\gamma+1)\nu - \gamma)(\nu - \gamma)^{\nu-1}.$$

イロト イポト イヨト イヨト

• 
$$H\overline{H}^T = (v - \gamma)I + \gamma J$$

- $\det(H) \in \mathbb{Z}[\zeta_m]$
- $\det(H\overline{H}^T) = \det(H)\overline{\det(H)} = ((\gamma + 1)\nu \gamma)(\nu \gamma)^{\nu 1}.$
- Therefore, we want to find criteria for the unsolvability of the equation

$$\alpha \overline{\alpha} = ((\gamma + 1)\nu - \gamma)(\nu - \gamma)^{\nu - 1}$$

## **Previous Work**

Checking solvability of this kinds of equations was studied in:

self conjugate condition [Brock,1988]
 Brock said that for a positive integer w there exists no solution α to the equation αā = w over Q(ζ<sub>m</sub>) if the square-free part of w is divisible by a prime which is self-conjugate modulo m in his work.

・ 同 ト ・ ヨ ト ・ ヨ ト

# Previous Work

Checking solvability of this kinds of equations was studied in:

- self conjugate condition [Brock,1988] Brock said that for a positive integer w there exists no solution α to the equation αā = w over Q(ζ<sub>m</sub>) if the square-free part of w is divisible by a prime which is self-conjugate modulo m in his work.
- Principal ideal decomposition [(Winterhof,Yayla,Ziegler),2014] Existence of  $\gamma$ -Butson Hadamard matrices for  $\gamma \in \mathbb{Z}$  condition is studied under an equation  $D = \alpha \overline{\alpha}$  with parameters m, v and  $\gamma \in \mathbb{Z}$ .

# Our Motivation

#### • What about the case $\gamma \in \mathbb{R} \cap \mathbb{Z}[\zeta_m] \setminus \mathbb{Z}$ ?

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

# Our Motivation

- What about the case  $\gamma \in \mathbb{R} \cap \mathbb{Z}[\zeta_m] \setminus \mathbb{Z}$ ?
- $\bullet~{\rm Obtain}~{\rm BH}_{\gamma}$  matrices having  $|\gamma|$  as small as possible

∃ ►

#### Results

- A new result stating necessary conditions for the nonexistence of a near Butson-Hadamard matrix (γ ∈ ℝ ∩ ℤ[ζ<sub>m</sub>]). Examples of nonexistence and existence cases by computer search.
- Consequences of our results applied to the concept of sequences and conference matrices. Examples of existence cases for nearly perfect sequences.

# Main Theorem

A condition for the non-existence of a solution  $\alpha \in \mathbb{Z}[\zeta_m]$  to this equation is presented in Theorem 3.

#### Theorem 3

Let  $D \in \mathbb{Z}[\zeta_m] \cap \mathbb{R}$  such that  $D = tq^{2e+1}$ 

- where  $q, t \in \mathbb{Z}[\zeta_m]$  and q is squarefree, provided that every prime ideal  $\mathfrak{t} \triangleleft \mathbb{Z}[\zeta_m]$  with  $\mathfrak{t}|(t)$  is principal,
- $(q) = q_1q_2$  where  $q_1$ ,  $q_2$  are non-principal prime ideals of  $\mathbb{Z}[\zeta_m]$ , e > 0 be rational integer,
- $gcd(2e+1-2k, h_m) = 1$  for  $0 \le k \le e-1$  and
- gcd(N(q), N(t)) = 1.

Then, there exists no  $\alpha \in \mathbb{Z}[\zeta_m]$  satisfying  $D = \alpha \overline{\alpha}$ .

・ロト ・回ト ・ヨト ・ヨト

# Proof

#### Proof.

We first assume that there exists  $\alpha \in \mathbb{Z}[\zeta_m]$  such that  $\alpha \bar{\alpha} = tq^{2e+1}$  such that

$$(\alpha) = \mathfrak{t}_1 \mathfrak{q}_1^{2e+1-k} \mathfrak{q}_2^k, (\bar{\alpha}) = \mathfrak{t}_2 \mathfrak{q}_1^k \mathfrak{q}_2^{2e+1-k}$$

for some  $\mathfrak{t} \lhd \mathbb{Z}[\zeta_m]$ . We have

$$(\alpha) = \mathfrak{t}_1 \mathfrak{q}_1^{2e+1-k} \mathfrak{q}_2^k = \mathfrak{t}_1 \mathfrak{q}_1^{2e+1-2k} q^k$$

We know that  $t_1$  and q are principal ideals of  $\mathbb{Z}[\zeta_m]$  but  $\mathfrak{q}_1^{2e+1-2k}$  is nonprincipal since  $gcd(2e+1-2k,h_m)=1$ . Hence we get a contradiction. Next, we assume that  $\alpha = \mathfrak{t}_1 q^s$ ,  $\bar{\alpha} = \mathfrak{t}_2 q^{2e+1-s}$  for some principal ideals  $\mathfrak{t}_1, \mathfrak{t}_2 \triangleleft \mathbb{Z}[\zeta_m]$  and  $s \in \mathbb{Z}^+ \cup \{0\}$ ,  $s \leq e$ . Then,  $q^{2e+1-2s}|\mathfrak{t}_1$ . However, this contradicts to  $gcd(N(q), N(\mathfrak{t})) = 1$ .

# Class Number Table

#### Table: The class number $h_m$ of $\mathbb{Q}(\zeta_m)$ for $m \leq 70$ [Washington1997].

 $\begin{array}{l} D = ((-\zeta_{23} - \zeta_{23}^{22})46 + 1 + \zeta_{23} + \zeta_{23}^{22})(47 + \zeta_{23} + \zeta_{23}^{22})^{45} \in \mathbb{Z}[\zeta_{23}] \\ \text{for } v = 46, \ m = 23, \ \gamma = -1 - \zeta_{23} - \zeta_{23}^{22} \\ D = \mathfrak{p}_1 \mathfrak{p}_2^{45} \mathfrak{p}_3^{45} \mathfrak{q}_4 \mathfrak{q}_5 \mathfrak{q}_6 \mathfrak{q}_7 \text{ where } \mathfrak{p}_1, \mathfrak{p}_2, \mathfrak{p}_3 \triangleleft \mathbb{Z}[\zeta_{23}] \text{ are principal prime} \\ \text{ideals and } \mathfrak{q}_4, \mathfrak{q}_5, \mathfrak{q}_6, \mathfrak{q}_7 \triangleleft \mathbb{Z}[\zeta_{23}] \text{ are the non-principal ideals.} \\ \text{The methodology in Example 4 does not work for this example.} \\ \text{Note that } (\alpha) = \mathfrak{t}_1 \mathfrak{q}_5 \mathfrak{q}_7^{38} \text{ is a principal ideal and satisfies } D = \alpha \bar{\alpha} \\ \text{for a convenient principal ideal } \mathfrak{t}_1 \triangleleft \mathbb{Z}[\zeta_{23}] \text{ such that } \mathfrak{t}_1 \mid D. \end{array}$ 

$$D = ((-\zeta_{23} - \zeta_{23}^{22})46 + 1 + \zeta_{23} + \zeta_{23}^{22})(47 + \zeta_{23} + \zeta_{23}^{22})^{45}$$

$$p_1 \qquad p_2^{45} \qquad p_3^{45} \qquad q_4 \qquad q_5 \qquad q_6 \qquad q_7$$

Figure: Ideal Decomposition of D for value  $v = 46, \gamma = 1 - \zeta_{23} - \zeta_{23}^{22}$ 

Ideal Factorization Method ○○○○○●○

#### Example 6

$$D = ((-\zeta_{23} - \zeta_{23}^{22})39 + 1 + \zeta_{23} + \zeta_{23}^{22})(40 + \zeta_{23} + \zeta_{23}^{22})^{38} \in \mathbb{Z}[\zeta_{23}]$$
for  $v = 39, m = 23, \gamma = -1 - \zeta_{23} - \zeta_{23}^{22}$ 

#### Example 6

$$\begin{split} D &= ((-\zeta_{23} - \zeta_{23}^{22})39 + 1 + \zeta_{23} + \zeta_{23}^{22})(40 + \zeta_{23} + \zeta_{23}^{22})^{38} \in \mathbb{Z}[\zeta_{23}] \\ \text{for } v &= 39, \ m = 23, \ \gamma = -1 - \zeta_{23} - \zeta_{23}^{22} \\ D &= \mathfrak{p}_1 \mathfrak{p}_2 \mathfrak{p}_3 \mathfrak{p}_4 \mathfrak{p}_5^2 \mathfrak{p}_6^{38} \mathfrak{p}_7^{38} \mathfrak{p}_8^{38} \mathfrak{q}_9 \mathfrak{q}_{10} \mathfrak{q}_{11}^{38} \mathfrak{q}_{12}^{38} \text{ where} \\ \mathfrak{p}_1, \mathfrak{p}_2, \mathfrak{p}_3, \mathfrak{p}_4, \mathfrak{p}_5, \mathfrak{p}_6, \mathfrak{p}_7, \mathfrak{p}_8 \lhd \mathbb{Z}[\zeta_{23}] \text{ are principal ideals and} \\ \mathfrak{q}_9, \mathfrak{q}_{10}, \mathfrak{q}_{11}, \mathfrak{q}_{12} \lhd \mathbb{Z}[\zeta_{23}] \text{ are non-principal ideals.} \end{split}$$

#### Example 6

 $\begin{array}{l} D = ((-\zeta_{23} - \zeta_{23}^{22})39 + 1 + \zeta_{23} + \zeta_{23}^{22})(40 + \zeta_{23} + \zeta_{23}^{22})^{38} \in \mathbb{Z}[\zeta_{23}] \\ \text{for } v = 39, \ m = 23, \ \gamma = -1 - \zeta_{23} - \zeta_{23}^{22} \\ D = \mathfrak{p}_1 \mathfrak{p}_2 \mathfrak{p}_3 \mathfrak{p}_4 \mathfrak{p}_5^2 \mathfrak{p}_6^{38} \mathfrak{p}_7^{38} \mathfrak{p}_8^{38} \mathfrak{q}_9 \mathfrak{q}_{10} \mathfrak{q}_{11}^{38} \mathfrak{q}_{12}^{38} \text{ where} \\ \mathfrak{p}_1, \mathfrak{p}_2, \mathfrak{p}_3, \mathfrak{p}_4, \mathfrak{p}_5, \mathfrak{p}_6, \mathfrak{p}_7, \mathfrak{p}_8 \lhd \mathbb{Z}[\zeta_{23}] \text{ are principal ideals and} \\ \mathfrak{q}_9, \mathfrak{q}_{10}, \mathfrak{q}_{11}, \mathfrak{q}_{12} \lhd \mathbb{Z}[\zeta_{23}] \text{ are non-principal ideals.} \\ \text{Note that } (\alpha) = \mathfrak{t}_1 \mathfrak{q}_{10} \mathfrak{q}_{12}^{38} \text{ is a principal ideal and satisfies } D = \alpha \bar{\alpha} \\ \text{for a convenient principal ideal } \mathfrak{t}_1 \lhd \mathbb{Z}[\zeta_{23}] \text{ such that } \mathfrak{t}_1 \mid D. \end{array}$ 

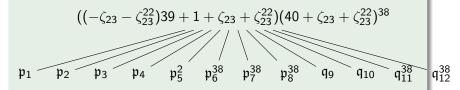

Figure: Ideal Decomposition of D for value  $v = 39, \gamma = 1 - \zeta_{23} - \zeta_{23}^{22}$ 

## Four Nonprincipal ideals

- Let  $q_1, q_2, q_3, q_4 \triangleleft \mathbb{Z}[\zeta_m]$  be non-principal prime ideals of  $\mathbb{Z}[\zeta_m]$  dividing D.
- Assume that  $q_1q_2, q_3q_4, q_1q_3, q_2q_4$  are all principal in  $\mathbb{Z}[\zeta_m]$ .
- If  $gcd(N(q_1q_2), N(q_3q_4)) = 1$ ,  $gcd(N(q_1q_3), N(q_2q_4)) = 1$ ,
- Then we can conclude that there exists no solution.

# Conference Matrix

#### Definition 7

A square matrix *C* of order *v* with 0 on the diagonal and all off-diagonal entries in  $\mathcal{E}_m$  is called a *near conference matrix*  $C_{\gamma}(v, m)$  if  $C\overline{C}^{T} = (v - 1 - \gamma)I + \gamma J$  for a  $\gamma \in \mathbb{R} \cap \mathbb{Z}[\zeta_m]$ .

・ロト ・ 日 ・ ・ 目 ・ ・ 日 ・ ・

# Conference Matrix

#### Definition 7

A square matrix *C* of order *v* with 0 on the diagonal and all off-diagonal entries in  $\mathcal{E}_m$  is called a *near conference matrix*  $C_{\gamma}(v, m)$  if  $C\overline{C}^T = (v - 1 - \gamma)I + \gamma J$  for a  $\gamma \in \mathbb{R} \cap \mathbb{Z}[\zeta_m]$ .

A matrix *C* with entries in  $\mathcal{E}_3$  and having the first row  $(0, \zeta_3^2, \zeta_3^2, \zeta_3^2, 1, \zeta_3^2, \zeta_3, \zeta_3, \zeta_3^2, 1, \zeta_3^2, \zeta_3^2, \zeta_3^2, \zeta_3^2)$  is an example of a circulant conference matrix. Note that  $C\overline{C}^T = 10I + 2J$ .

# Conference Matrix

Similar to the case near Butson-Hadamard matrices, we obtain that a near conference matrix  $C = C_{\gamma}(v, m)$  satisfies

$$\mathsf{det}(\mathcal{C})\overline{\mathsf{det}(\mathcal{C})} = (\gamma+1)(
u-1)(
u-1-\gamma)^{
u-1}$$

and hence we have

$$\alpha \overline{\alpha} = (\gamma + 1)(\nu - 1)(\nu - 1 - \gamma)^{\nu - 1}.$$

臣

## Sequences

• 
$$\underline{a} = (a_0, a_1, \dots, a_{\nu-1}, \dots)$$
 *v*-periodic sequence

• an *m*-ary sequence if  

$$a_0, a_1, \dots, a_{v-1} \in \mathcal{E}_m = \{1, \zeta_m, \zeta_m^2, \dots, \zeta_m^{m-1}\}$$

• an almost m-ary sequence if  $a_0 = 0$  and  $a_1, \ldots, a_{\nu-1} \in \mathcal{E}_m$ .

イロン イヨン イヨン イヨン

## Sequences

- an almost m-ary sequence if  $a_0 = 0$  and  $a_1, \ldots, a_{\nu-1} \in \mathcal{E}_m$ .
- For 0 ≤ t ≤ v − 1, the autocorrelation function C<sub>a</sub>(t) is defined by

$$C_{\underline{a}}(t) = \sum_{i=0}^{\nu-1} a_i \overline{a_{i+t}},$$

where  $\overline{a}$  is the complex conjugate of a.

## • Perfect Sequence (PS) if $C_{\underline{a}}(t) = 0$ for all $1 \le t \le v - 1$ .

イロン イヨン イヨン イヨン

- Perfect Sequence (PS) if  $C_{\underline{a}}(t) = 0$  for all  $1 \le t \le v 1$ .
- Nearly Perfect Sequence (NPS) of type  $\gamma$  if  $C_{\underline{a}}(t) = \gamma$  for all  $1 \le t \le v 1$ .

イロト イポト イヨト イヨト

- Perfect Sequence (PS) if  $C_{\underline{a}}(t) = 0$  for all  $1 \le t \le v 1$ .
- Nearly Perfect Sequence (NPS) of type  $\gamma$  if  $C_{\underline{a}}(t) = \gamma$  for all  $1 \le t \le v 1$ .
- For instance,  $(0, \zeta_3^2, \zeta_3^2, \zeta_3^2, 1, \zeta_3^2, \zeta_3, \zeta_3, \zeta_3^2, 1, \zeta_3^2, \zeta_3^2, \zeta_3^2)$  is a 3-ary NPS of period 13 and type  $\gamma = 2$ .

イロト イポト イヨト イヨト

If a NPS of type  $\gamma$  exists, then  $\gamma$  is a real number.

イロン イヨン イヨン イヨン

If a NPS of type  $\gamma$  exists, then  $\gamma$  is a real number.

#### Remark 8

 NPSs are equivalent to circulant γ-Butson-Hadamard matrices and conference matrices.

イロト イポト イヨト イヨト

If a NPS of type  $\gamma$  exists, then  $\gamma$  is a real number.

#### Remark 8

- NPSs are equivalent to circulant γ-Butson-Hadamard matrices and conference matrices.
- Let  $\underline{a} = (a_0, a_1, \dots, a_{v-1}, \dots)$  be an m-ary NPS of period v.

・ロト ・四ト ・ヨト ・ヨト

If a NPS of type  $\gamma$  exists, then  $\gamma$  is a real number.

### Remark 8

- NPSs are equivalent to circulant γ-Butson-Hadamard matrices and conference matrices.
- Let  $\underline{a} = (a_0, a_1, \dots, a_{v-1}, \dots)$  be an m-ary NPS of period v.
- Let H = (h<sub>i,j</sub>) be a circulant matrix defined by h<sub>0,j</sub> = a<sub>j</sub> for j = 0, 1, ..., v - 1 then H is a circulant near Butson-Hadamard matrix of order v.

イロト イポト イヨト イヨト

If a NPS of type  $\gamma$  exists, then  $\gamma$  is a real number.

### Remark 8

- NPSs are equivalent to circulant γ-Butson-Hadamard matrices and conference matrices.
- Let  $\underline{a} = (a_0, a_1, \dots, a_{v-1}, \dots)$  be an m-ary NPS of period v.
- Let H = (h<sub>i,j</sub>) be a circulant matrix defined by h<sub>0,j</sub> = a<sub>j</sub> for j = 0, 1, ..., v - 1 then H is a circulant near Butson-Hadamard matrix of order v.
- Similarly, an almost m-ary NPS is equivalent to a circulant near conference matrix.

Ideal Factorization Method

#### Corollary 9

Let  $v, m \in \mathbb{Z}^+$  and  $\gamma \in \mathbb{Z}[\zeta_m] \cap \mathbb{R}$  such that  $D = ((\gamma + 1)v - \gamma)(v - \gamma)^{v-1}$  and  $D = tq^{2e+1}$  where  $q, t \in \mathbb{Z}[\zeta_m]$  and qis squarefree. Suppose that (i) to (iv) are satisfied.

- (i) Every prime ideal  $\mathfrak{t} \triangleleft \mathbb{Z}[\zeta_m]$  with  $\mathfrak{t}|(t)$  is principal.
- (ii)  $(q) = q_1q_2$  where  $q_1$  and  $q_2$  are non-principal prime ideals of  $\mathbb{Z}[\zeta_m]$ .
- (iii) e > 0 be rational integer,  $gcd(2e + 1 2k, h_m) = 1$  for  $0 \le k \le e 1$ .
- (iv) gcd(N(q), N(t)) = 1.

#### Corollary 9

Let  $v, m \in \mathbb{Z}^+$  and  $\gamma \in \mathbb{Z}[\zeta_m] \cap \mathbb{R}$  such that  $D = ((\gamma + 1)v - \gamma)(v - \gamma)^{v-1}$  and  $D = tq^{2e+1}$  where  $q, t \in \mathbb{Z}[\zeta_m]$  and qis squarefree. Suppose that (i) to (iv) are satisfied.

- (i) Every prime ideal  $\mathfrak{t} \triangleleft \mathbb{Z}[\zeta_m]$  with  $\mathfrak{t}|(t)$  is principal.
- (ii)  $(q) = q_1q_2$  where  $q_1$  and  $q_2$  are non-principal prime ideals of  $\mathbb{Z}[\zeta_m]$ .
- (iii) e > 0 be rational integer,  $gcd(2e + 1 2k, h_m) = 1$  for  $0 \le k \le e 1$ .
- (iv) gcd(N(q), N(t)) = 1.

Then the following hold:

- (i) there exists no  $BH_{\gamma}(v, m)$ .
- (ii) there exists no v-periodic m-ary NPS of type  $\gamma$ .

### Corollary 10

Let  $v, m \in \mathbb{Z}^+$ ,  $\gamma \in \mathbb{Z}[\zeta_m] \cap \mathbb{R}$  such that  $D = (\gamma + 1)(v - 1)(v - 1 - \gamma)^{v-1}$  and  $D = tq^{2e+1}$  where  $q, t \in \mathbb{Z}[\zeta_m]$  and q is squarefree. If the conditions (i) - (iv) given in Corollary 9 are satisfied, then

## Corollary 10

Let  $v, m \in \mathbb{Z}^+$ ,  $\gamma \in \mathbb{Z}[\zeta_m] \cap \mathbb{R}$  such that  $D = (\gamma + 1)(v - 1)(v - 1 - \gamma)^{v-1}$  and  $D = tq^{2e+1}$  where  $q, t \in \mathbb{Z}[\zeta_m]$  and q is squarefree. If the conditions (i) - (iv) given in Corollary 9 are satisfied, then

- There exists no  $\mathrm{C}_{\gamma}(v,m)$ ,
- There exists no v-periodic an almost m-ary NPS of type  $\gamma$ .

## Example 11

Consider BH<sub>$$\gamma$$</sub>(67, 23),  $\gamma = -1 - \zeta_{23}$ ,  $v = 67$  and  $m = 23$ .

$$lpha\overline{lpha} = (1 - 66\zeta_{23})(68 + \zeta_{23})^{66}$$

Every prime ideal dividing  $(68 + \zeta_{23})^{66}$  is principal.  $(1 - 66\zeta_{23})$  has the non-principal ideal decomposition over  $\mathbb{Z}[\zeta_{23}]$ . Hence, BH<sub> $\gamma$ </sub>(67, 23) does not exist by Corollary 9.

#### Example 11

Consider BH<sub>$$\gamma$$</sub>(67, 23),  $\gamma = -1 - \zeta_{23}$ ,  $v = 67$  and  $m = 23$ .

$$\alpha \overline{\alpha} = (1 - 66\zeta_{23})(68 + \zeta_{23})^{66}$$

Every prime ideal dividing  $(68 + \zeta_{23})^{66}$  is principal.  $(1 - 66\zeta_{23})$  has the non-principal ideal decomposition over  $\mathbb{Z}[\zeta_{23}]$ . Hence, BH<sub> $\gamma$ </sub>(67, 23) does not exist by Corollary 9. Furthermore, we conclude that a 23-ary NPS of period 67 and  $\gamma = -1 - \zeta_{23}$  does not exist.
