Operations on binary relations

Let U be a set. We define operations on elements of $\wp(U \times U)$.

Domain

$$D(X) = \{(u, u) \mid (u, v) \in X \text{ for some } v \in U\}$$

Range

$$R(X) = \{(v, v) \mid (u, v) \in X \text{ for some } u \in U\}$$

Composition

$$X;Y = \{(u, v) \mid (u, w) \in X \text{ and } (w, v) \in Y \text{ for some } w \in U\}$$

Identity

$$1' = \{(u, u) \mid u \in U\}$$

Antidomain

$$A(X) = \{(u, u) \mid u \in U, (u, v) \notin X \text{ for any } v\}$$

Converse

$$X^\smile = \{(u, v) \mid (v, u) \in X\}$$

for every $X, Y \subseteq U \times U$.

Domain–range semigroups

Representable domain–range semigroups

A *representable domain–range semigroup* is a subalgebra of

$$(\wp(U \times U), D, R, ;)$$

With motivation in software verification:

Jipsen and Struth

Is the class $\mathbb{R}(D, R, ;)$ of representable domain–range semigroups finitely axiomatizable?

[Hirsch and M, J LAP 2011]

Let τ be a similarity type such that $\{D, ;\} \subseteq \tau \subseteq \{D, R, A, ;, 1', 0\}$. The class $\mathbb{R}(\tau)$ of representable τ -algebras is not finitely axiomatizable in first-order logic.

Adding a semilattice structure?

Adding join?

[Hirsch and M, JLAP 2011] using [Andréka 1988]

Let τ be a similarity type such that

$\{;, +\} \subseteq \tau \subseteq \{D, R, A, ;, +, \smile, *, 1', 0, 1\}$. The class $\mathbb{R}(\tau)$ of representable τ -algebras is not finitely axiomatizable in first-order logic.

Adding meet?

[Hirsch and M, AU 2007]

The class $\mathbb{R}(;, \cdot, 1')$ is not finitely axiomatizable in first-order logic.

An ultraproduct construction of non-representable algebras, where $1'$ is an atom. Thus we can augment these algebras with D, R . Thus $\mathbb{R}(D, R, ;, \cdot)$ is not finitely axiomatizable.

Adding a lattice structure?

[Andréka, AU 1991]

Let τ be a similarity type such that $\{;, +, \cdot\} \subseteq \tau \subseteq \{;, +, \cdot, -, \smile, *, 1', 0, 1\}$. The class $\mathbb{R}(\tau)$ of representable τ -algebras is not finitely axiomatizable in first-order logic.

Another ultraproduct construction. Observe that we can define $D(x) = (x ; x^\smile) \cdot 1'$, $R(x) = (x^\smile ; x) \cdot 1'$ and $A(x) = -D(x) \cdot 1'$. Thus $\mathbb{R}(D, R, A, ;, +, \cdot, \dots)$ is not finitely axiomatizable.

Axiomatizing the equational theory

Recall that *antidomain* is defined as

$$A(X) = \{(u, u) \mid (u, v) \notin X \text{ for any } v\}$$

Observe that $D(x) = A(A(x))$.

[Hollenberg, JOLLI 1997]

The varieties $\mathbb{V}(A, ;)$ and $\mathbb{V}(A, ;, +)$ generated by $\mathbb{R}(A, ;)$ and $\mathbb{R}(A, ;, +)$, respectively, are finitely axiomatizable.

Our main result is:

Jackson and M

The variety $\mathbb{V}(D, R, ;, +)$ generated by $\mathbb{R}(D, R, ;, +)$ is finitely axiomatizable.

Ordered domain–range semigroups

Define $x \leq y$ by $x + y = y$.

The axioms Ax :

$$(D1) \quad D(x); x = x$$

$$(D2) \quad D(x; y) = D(x; D(y))$$

$$(D3) \quad D(D(x); y) = D(x); D(y)$$

$$(D4) \quad D(x); D(y) = D(y); D(x)$$

$$(D5) \quad D(R(x)) = R(x)$$

$$(D6) \quad D(x); y \leq y$$

$$(R1) \quad x; R(x) = x$$

$$(R2) \quad R(x; y) = R(R(x); y)$$

$$(R3) \quad R(x; R(y)) = R(x); R(y)$$

$$(R4) \quad R(x); R(y) = R(y); R(x)$$

$$(R5) \quad R(D(x)) = D(x)$$

$$(R6) \quad x; R(y) \leq x$$

together with associativity of $;$ and $+$, idempotency of $+$ and additivity of $;$, D , R .

Eliminating join

Assume

$$\forall (D, R, ;, +) \models s \leq t$$

and we need $Ax \vdash s \leq t$, for all terms s, t .

Using additivity of the operations we have that

$$\forall (D, R, ;, +) \models s_1 + \dots + s_n = s \leq t = t_1 + \dots + t_m$$

for some join-free terms $s_1, \dots, s_n, t_1, \dots, t_m$.

It is not difficult to show that this happens iff for every i there is j such that

$$\forall (D, R, ;, +) \models s_i \leq t_j$$

Thus it is enough to show $Ax \vdash s_i \leq t_j$ for join-free terms.

Domain elements (in the free algebra)

Claim

Let \mathfrak{A} be a model of Ax .

- 1 The algebra $(D(A), ;)$ of domain elements is a (lower) semilattice and the semilattice ordering coincides with \leq .
- 2 For every $a \in A$, $D(a)$ (resp. $R(a)$) is the minimal element d in $D(A)$ such that $d ; a = a$ (resp. $a ; d = a$).

Let $\mathfrak{F}_{Var} = (F_{Var}, ;, D, R, +)$ be the free algebra of the variety defined by Ax freely generated by a set Var of variables.

Claim

Let r, s, t be join-free terms such that $\mathfrak{F}_{Var} \models D(r) \leq s ; t$. Then $\mathfrak{F}_{Var} \models D(r) \leq s = D(s)$ and $\mathfrak{F}_{Var} \models D(r) \leq t = D(t)$.

Claim

Let s, t be join-free terms such that $\mathfrak{F}_{Var} \models s \leq D(t)$. Then $\mathfrak{F}_{Var} \models s = D(s)$.

Creating a representable algebra witnessing $Ax \not\vdash s \leq t$

Let T_{Var}^- be the set of join-free terms and $s, t \in T_{Var}^-$. We assume that $Ax \not\vdash s \leq t$ and we will construct a representable algebra $\mathfrak{A} \in \mathbb{R}(D, R, ;, +)$ witnessing $s \not\leq t$: $\mathfrak{A} \not\vdash s \leq t$.

Let F_{Var}^- be the equivalence classes of join-free terms (elements of \mathfrak{F}_{Var}). We will define a labelled, directed graph G_ω as the union of a chain of labelled, directed graphs $G_n = (U_n, \ell_n, E_n)$ for $n \in \omega$, where

- U_n is the set of nodes,
- $\ell_n: U_n \times U_n \rightarrow \wp(F_{Var}^-)$ is a labelling of edges,
- $E_n = \{(u, v) \in U_n \times U_n \mid \ell_n(u, v) \neq \emptyset\}$

Coherence

We will make sure that the following *coherence conditions* are maintained during the construction:

GenC E_n is a reflexive, transitive and antisymmetric relation on U_n .

PriC For every $(u, v) \in E_n$, $\ell_n(u, v)$ is a principal upset:

$$\ell_n(u, v) = a^\uparrow = \{x \in F_{Var}^- \mid a \leq x\} \text{ for some } a \in F_{Var}^-.$$

CompC For all $(u, v), (u, w), (w, v) \in U_n \times U_n$ and $a, b \in F_{Var}^-$, if $a \in \ell_n(u, w)$ and $b \in \ell_n(w, v)$, then $a; b \in \ell_n(u, v)$.

DomC For all $(u, v) \in U_n \times U_n$ and $a \in F_{Var}^-$, if $\ell_n(u, v) = a^\uparrow$, then $\ell_n(u, u) = D(a)^\uparrow$.

RanC For all $(u, v) \in U_n \times U_n$ and $a \in F_{Var}^-$, if $\ell_n(u, v) = a^\uparrow$, then $\ell_n(v, v) = R(a)^\uparrow$.

IdeC For all $(u, v) \in U_n \times U_n$, $u = v$ iff $\ell_n(u, v) = D(a)^\uparrow$ for some $a \in F_{Var}^-$.

Saturation

The construction will terminate in ω steps, yielding $G_\omega = (U_\omega, \ell_\omega, E_\omega)$ where $U_\omega = \bigcup_n U_n$, $\ell_\omega = \bigcup_n \ell_n$ and $E_\omega = \bigcup_n E_n$.

By the end of the construction we will achieve the following *saturation conditions*:

- CompS** For all $(u, v) \in U_\omega \times U_\omega$ and $a, b \in F_{Var}^-$, if $a ; b \in \ell_\omega(u, v)$, then $a \in \ell_\omega(u, w)$ and $b \in \ell_\omega(w, v)$ for some $w \in U_\omega$.
- DomS** For all $(u, u) \in U_\omega \times U_\omega$ and $a \in F_{Var}^-$, if $D(a) \in \ell_\omega(u, u)$, then $a \in \ell_\omega(u, w)$ for some $w \in U_\omega$.
- RanS** For all $(u, u) \in U_\omega \times U_\omega$ and $a \in F_{Var}^-$, if $R(a) \in \ell_\omega(u, u)$, then $a \in \ell_\omega(w, u)$ for some $w \in U_\omega$.

Initial step

In the 0th step of the step-by-step construction we define

$G_0 = (U_0, \ell_0, W_0)$ by creating an edge for every element of F_{Var}^- . We define U_0 by choosing elements $u_a, v_a, \dots \in \omega$ so that $\{u_a, v_a\} \cap \{u_b, v_b\} = \emptyset$ for distinct a, b , and $u_a = v_a$ iff $D(a) = a$ (i.e., a is a domain element of \mathfrak{F}_{Var}). We can assume that $|\omega \setminus U_0| = \omega$. We define

$$\ell_0(u_a, v_a) = a^\uparrow$$

$$\ell_0(u_a, u_a) = D(a)^\uparrow$$

$$\ell_0(v_a, v_a) = R(a)^\uparrow$$

and we label all other edges by \emptyset .

Step for domain

Our aim is to extend G_m to create an edge (u, w) witnessing a , provided $D(a) \in \ell_m(u, u) = c^\uparrow$.

Domain step

We assume that we have a loop (u, u) labelled by the upset of a domain element $c = D(c) \leq a$ such that $D(c)$; a is not a domain element, but we may miss an edge (u, w) witnessing a .

We choose $w \in \omega \setminus U_m$, extend ℓ_m by

$$\ell_{m+1}(u, w) = (D(c); a)^\uparrow$$

$$\ell_{m+1}(w, w) = (R(D(c); a))^\uparrow$$

and for every $(p, u) \in E_m$ with $\ell_m(p, u) = d^\uparrow$ (some $d \in F_{Var}^-$)

$$\ell_{m+1}(p, w) = (d; a)^\uparrow$$

All other edges involving the point w have empty labels.

Step for composition

Our aim is to extend G_m to create edges (u, w) and (w, v) witnessing a and b , provided $a; b \in \ell_m(u, v) = c^\uparrow$.

Composition step

We assume that

$$(CC1) \quad u \neq v,$$

$$(CC2) \quad D(c); a; D(b; R(c)) \neq D(D(c); a; D(b; R(c))),$$

$$(CC3) \quad R(D(c); a); b; R(c) \neq R(R(D(c); a); b; R(c)),$$

otherwise we define $G_{m+1} = G_m$. If (CC1)–(CC3) hold, then we choose $w \in \omega \setminus U_m$, extend ℓ_m by

$$\ell_{m+1}(u, w) = (D(c); a; D(b; R(c)))^\uparrow$$

$$\ell_{m+1}(w, v) = (R(D(c); a); b; R(c))^\uparrow$$

$$\ell_{m+1}(w, w) = (R(D(c); a); D(b; R(c)))^\uparrow$$

and for $(p, u), (v, q) \in E_m$ with $\ell_m(p, u) = d^\uparrow$ and $\ell_m(v, q) = e^\uparrow$ (some $d, e \in F_{Var}^-$)

$$\ell_{m+1}(p, w) = (d; a; D(b; R(c)))^\uparrow$$

$$\ell_{m+1}(w, q) = (R(D(c); a); b; e)^\uparrow$$

All other edges involving w will have empty labels.

In the limit

Lemma

G_ω is coherent and saturated.

Coherence of G_ω follows from the coherence of each G_m (easy but tedious). Saturation of G_ω follows from the fact that we constructed the required witness edges (if they were not present yet in G_m).

Next we define a valuation \flat of variables. Let for term r , its equivalence class in F_{Var} be denoted by \bar{r} . We let

$$x^\flat = \{(u, v) \in U_\omega \times U_\omega : \bar{x} \in \ell_\omega(u, v)\}$$

for every variable $x \in Var$.

Truth lemma

Let $\mathfrak{A} = (A, D, R, ;, +)$ be the subalgebra of the full algebra $(\wp(U_\omega \times U_\omega), D, R, ;, +)$ generated by $\{x^b : x \in \text{Var}\}$. Clearly \mathfrak{A} is representable.

Lemma

For every join-free term r and $(u, v) \in U_\omega \times U_\omega$,

$$(u, v) \in r^b \text{ iff } \bar{r} \in \ell_\omega(u, v)$$

where r^b is the interpretation of r in \mathfrak{A} under the valuation b .

By coherence and saturation of G_ω .

Recall that we assumed that $\mathfrak{F}_{\text{Var}} \not\models s \leq t$. In the initial step of the construction we created the edge $(u_{\bar{s}}, v_{\bar{s}})$ such that $\ell_0(u_{\bar{s}}, v_{\bar{s}}) = \bar{s}^\uparrow$. Thus $\bar{s} \in \ell_\omega(u_{\bar{s}}, v_{\bar{s}})$ and $\bar{t} \notin \ell_\omega(u_{\bar{s}}, v_{\bar{s}})$. Hence, by Lemma, $(u_{\bar{s}}, v_{\bar{s}}) \in s^b$ and $(u_{\bar{s}}, v_{\bar{s}}) \notin t^b$. That is, $\mathfrak{A} \not\models s \leq t$, as desired.

Open problems

Adding meet and/or antidomain.

Open problems

Are the varieties generated by

- $\mathbb{R}(D, R, A, ;, +)$
- $\mathbb{R}(D, R, ;, +, \cdot)$
- $\mathbb{R}(D, R, A, ;, +, \cdot)$

finitely axiomatizable?
